Fluorescent purine derivatives have a variety of uses in analytics, such as metal ion [1] and pH sensors [2], as well they are used for cell imaging [3] and as photo-catalysts [4].

Target purine compound **2** was designed with an aim to be used as a potential system for photo-catalysis. For the synthesis of **2**, derivatization of C(6), C(8) and N(9) positions of 6-chloropurine (**1**) with **A**, **B** and **C** moieties is required. Several synthetic pathways were designed and have been tested. In the end, target compound **2** was obtained, using the combinations of S_NAr, S_N2, CuAAC, C-C metal catalyzed coupling, alkylation and Mitsunobu reactions and these results will be discussed.

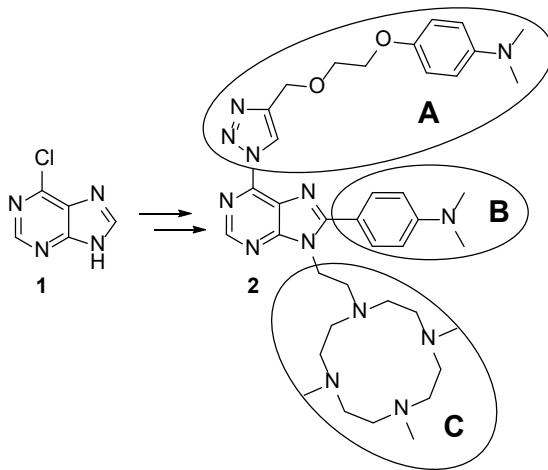

Fig. Starting material **1** and target compound **2**.
